

CODEX-AUTHORED REPORT FOR CAS-621F

Two workers, fourteen jokes, one small verification jam.

This report reconstructs the June 30, 2026 factory smoke test from local task records, the shared CAS log, visible coordination messages already surfaced during execution, and clean-worktree checks for both worker worktrees. It is intentionally independent of the parallel Claude report. No Claude HTML report existed in `docs/reports/` at the time this Codex report was authored, so `smoke-test-2026-06-30-codex-jester.html` avoids filename conflict by default.

14

Total jokes delivered across both workers.

2/2

Worker worktrees checked locally and found clean by `git status --short` and `git diff --stat`.

1

Lifecycle interruption observed: Codex close hit verification jail before supervisor approval cleared it.

Observed outcome

The smoke test succeeded. Both workers produced seven computer jokes, both avoided repository edits during the joke tasks, and both communicated with the supervisor through CAS coordination messages. Claude closed cleanly within the task record. Codex required one supervisor-mediated verification step before its close was accepted.

Director behavior is only partially observable from local artifacts: the shared log records director event deliveries, but not the full body of every director prompt. Where this report draws conclusions about the director, those points are labeled as inference from delivery traces and downstream worker/supervisor actions.

Worker outputs

CLAUDE-JESTER / CAS-73BA

1. **Why do programmers prefer dark mode?** Because light attracts bugs.
2. **A SQL query walks into a bar, approaches two tables and asks...** "Can I join you?"
3. **Why don't programmers like nature?** It has too many bugs and no documentation.
4. **How many programmers does it take to change a light bulb?** None — that's a hardware problem.
5. **A programmer's wife says:** "Go to the store, get a gallon of milk, and if they have eggs, get a dozen." He comes home with 12 gallons of milk. "They had eggs."
6. **Why was the JavaScript developer sad?** Because they didn't

CODEX-JESTER / CAS-2650

1. Why do programmers prefer dark mode? Because light attracts bugs.
2. There are 10 kinds of people in the world: those who understand binary and those who don't.
3. I told my computer I needed a break, and now it won't stop sending me beach wallpapers.
4. Why did the developer go broke? Because he used up all his cache.
5. My code doesn't have bugs. It just develops random features.
6. Why was the computer cold? It left its Windows open.
7. I asked the keyboard for advice, but it just kept giving me mixed signals.

Node how to Express their feelings.

7. **There are 10 types of people in the world:** those who understand binary, and those who don't.

CAS rule-following assessment

claude-jester

Pass with minimal friction.
Claude followed the core worker rules visible from local evidence: it stayed within task scope, avoided repository edits for the joke task, delivered the requested output, and closed the task. The `cas - 73ba` task record shows a clean close and explicitly notes that no files were edited.

codex-jester

Pass with one lifecycle blocker handled correctly.
Codex followed the one-task-at-a-time rule, posted progress notes, delivered the jokes, verified a clean worktree, and reported the exact verification-jail blocker rather than retrying or spawning a verifier. The subsequent supervisor-approved close matches the expected worker behavior under the CAS worker instructions.

Supervisor and director behavior

Supervisor

Effective and rule-aligned.
The supervisor translated the smoke test into explicit worker instructions, acknowledged execution plans, requested clean-worktree proof, and handled the verification-jail event appropriately by supplying the approved verification needed for the Codex close. This is directly evidenced by the visible coordination messages and the `cas - 2650` task note trail.

Director

Active, but only partly transparent from local artifacts.
Direct local evidence shows multiple `director_events` deliveries to the supervisor and both workers during the smoke test and follow-up reporting window. The director appears to have been responsive in assigning and

nudging work, but the log does not preserve full prompt bodies for each director event, so a stronger quality judgment would be inference rather than proof.

Notable smoke-test observations

WHAT WORKED

Parallel worker execution was easy to observe. The shared log records clean worker spawn activity for both `claude-jester` and `codex-jester`, prompt delivery latencies were short, and both workers produced their outputs quickly after task assignment.

WHAT WOBBLED

The Codex branch of the smoke test exposed a verification-jail edge in which a no-edit task still needed supervisor verification before close. That did not break completion, but it did add one manual handoff step to an otherwise simple smoke test.

Evidence ledger

Task records `mcp__cs__task action=show id=cas-73ba`
`mcp__cs__task action=show id=cas-2650`

Shared log `/home/pippenz/Petrastella/cas-src/.cas/logs/cas-2026-06-30.log`

Worktree paths `/home/pippenz/Petrastella/cas-src/.cas/worktrees/claude-jester`
`/home/pippenz/Petrastella/cas-src/.cas/worktrees/codex-jester`

Worktree proof Local `git status --short` and `git diff --stat` checks in both worker worktrees produced no output during evidence review.

**Coordination
evidence**

Supervisor and worker coordination messages already surfaced during the smoke test were used to recover the exact joke payloads and the Codex verification-jail handoff. This report intentionally avoids any further live database exploration.
